Project Name: Completed tasks for Anderson company

**Given bracket sequence: [(((())()())]**

1. *Can this sequence be considered correct?*

A sequence of brackets is considered correct if every opening bracket has a corresponding closing bracket in the correct order.

In this sequence, there is an imbalance: there is one extra closing square bracket ] at the end and not enough one closing parentheses ).

Therefore, the sequence is not balanced and it's incorrect.

2. *What needs to be changed in it to make it correct?*

To make the sequence correct, it's necessary to change extra closing square bracket with one closing parentheses, making it [(((())()())]. It would be the correct. Also we can remove one extra opening parentheses and one extra closing square, making it [(())(())]. This sequence is also balanced and correct.
